

A complex network graph with nodes and edges, overlaid with a large blue title and a green dashed line. The nodes are represented by red circles and blue squares with a cross-hatch pattern. The edges are thin grey lines connecting the nodes. A large, bold blue title is centered over the graph. A green dashed line curves across the bottom of the graph.

# How Access to Markets Impacts Social Networks, Consumption, and Diffusion

Matthew O. Jackson

# Growing Application Areas:

- Labor/Education: job contact networks, peer influence
- Development: social learning, diffusion, norms
- Public: corruption, crime
- Organizations: learning, teams, culture
- Political Economy: alliances, conflict, polarization
- Trade and Macro: shock propagation,
- Finance: contagion, intermediation, efficiency

# Networks

Symbiotic relationship between informal networks and formal markets:

- Network structure determines market participation
- Market participation changes network structure

# Externalities!

- Network connections determine who knows loans available
- Access to loans changes informal networks borrowing/lending
- Changes in borrowers' networks affect non-borrowers' networks
- Changing borrowing networks also affects advice networks...
- Advice networks impact diffusion, but so do other networks...

# Outline

- **Diffusion on networks impacts market participation**
- **Networks are changed by the market, multiple layers**
- **Multiple layers of networks impact diffusion**

# Outline

- **Diffusion on networks impacts market participation**
- **Networks are changed by the market, multiple layers**
- **Multiple layers of networks impact diffusion**

# Background - Microfinance

- Karnataka India 75 villages:
  - 43 offered microfinance loans
  - 32 controls

# Background - Microfinance

- Karnataka India 75 villages:
  - 43 offered microfinance loans
  - 32 controls

Banerjee, Chandrasekhar, Duflo, Jackson (Science 2013, Restud 2019)

Banerjee, Breza, Chandrasekhar, Duflo, Jackson, Kinnan (Restud, 2023)

# Networks influencing Market Participation

- Some villages had much more loan participation than others
- Do initial contact/injection points of microfinance information matter?
- How should we measure influence/centrality?

Karnataka

Borrow:

Temple

Advice

**Kero-Come**

**Medic**

# Centrality and Information Diffusion

- In each village bank told a few `leaders' about the availability of loans and asked them to spread information
- In some villages these people were very central and good spreaders of information, in other villages they were not central
- How should we measure influence/centrality?

# Centrality Measures:

- Most basic measure -- simply count how many links a node has:

- Degree Centrality

# Degree Centrality?

- More reach if connected to a 6 and 7 than a 2 and 2?

# Eigenvector Centrality

- Centrality is proportional to the sum of neighbors' centralities

$$C_i \text{ proportional to } \sum_{j: \text{ friend of } i} C_j$$

# Eigenvector Centrality

Now distinguishes more “influential” nodes

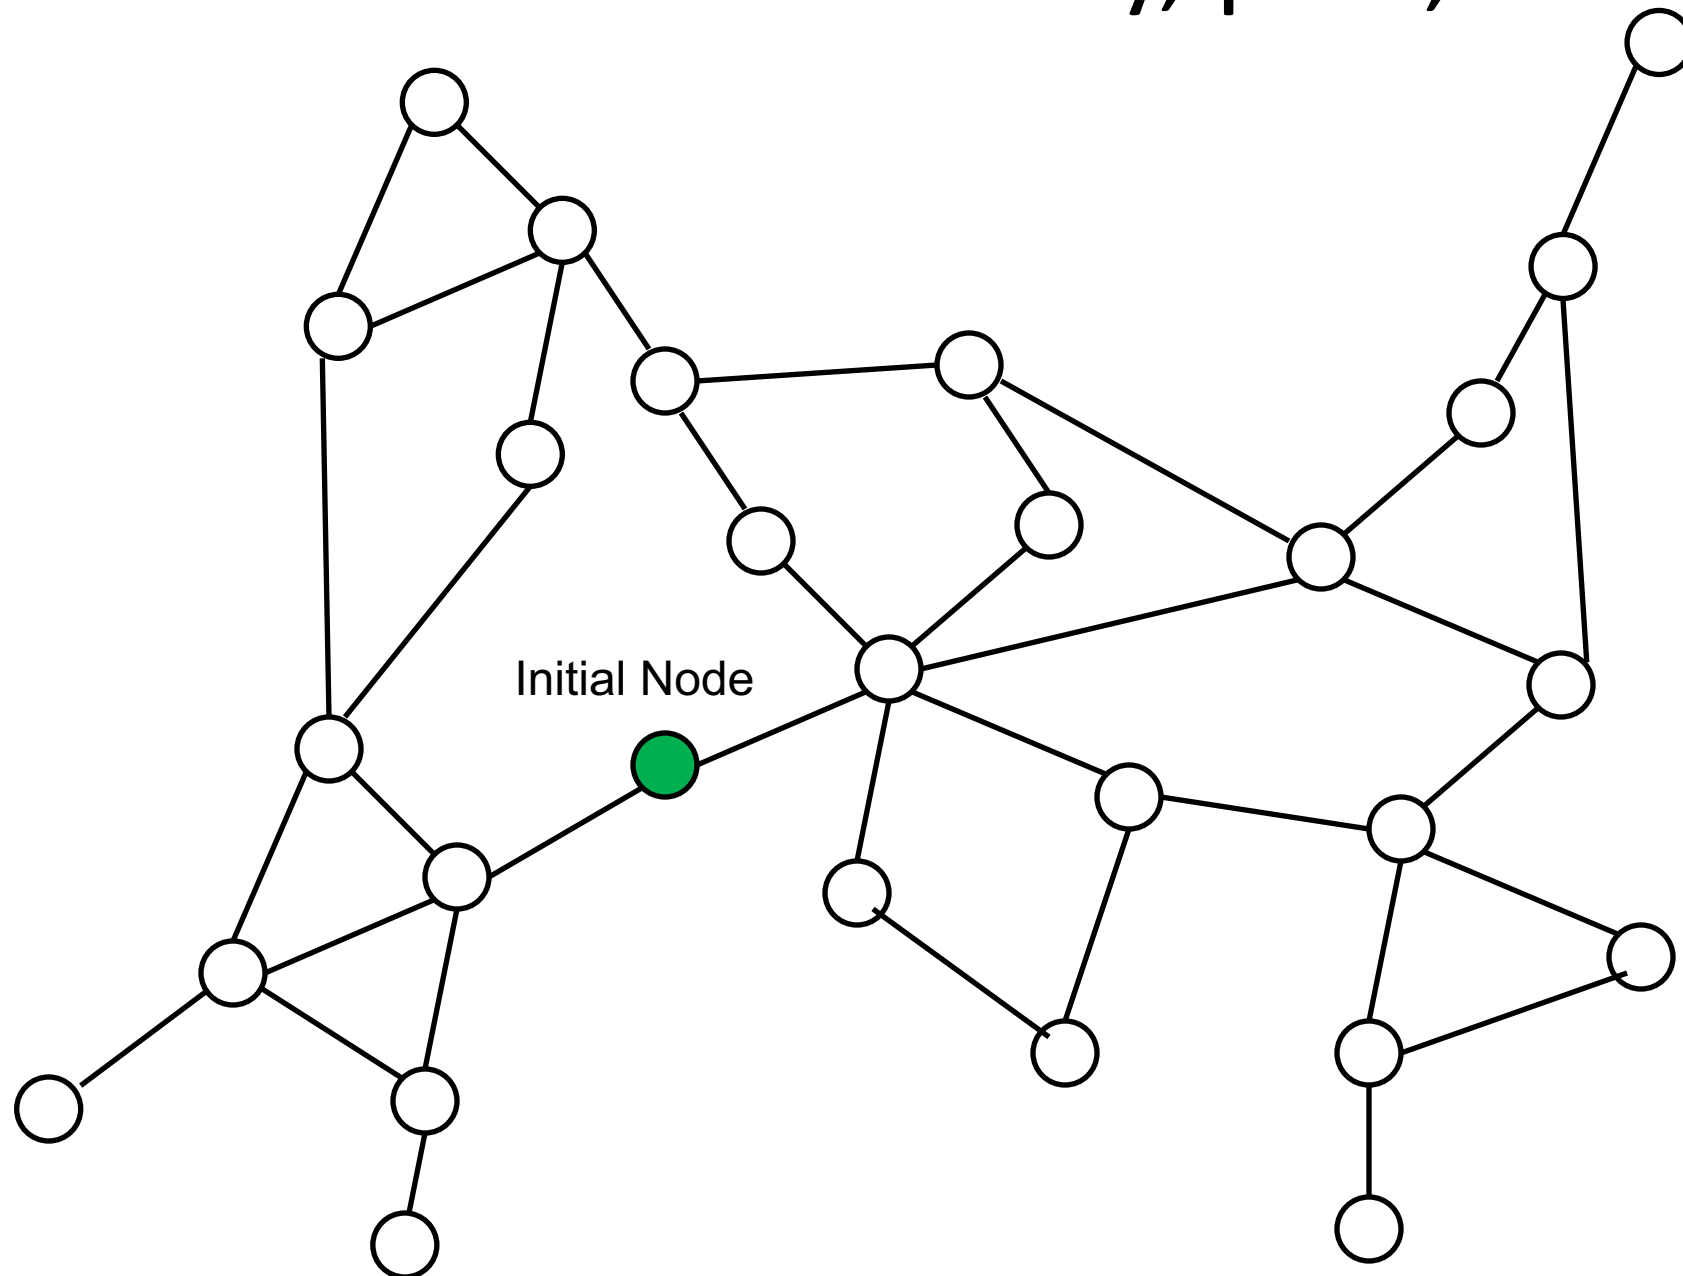

# Diffusion Centrality: $DC_i(p, T)$

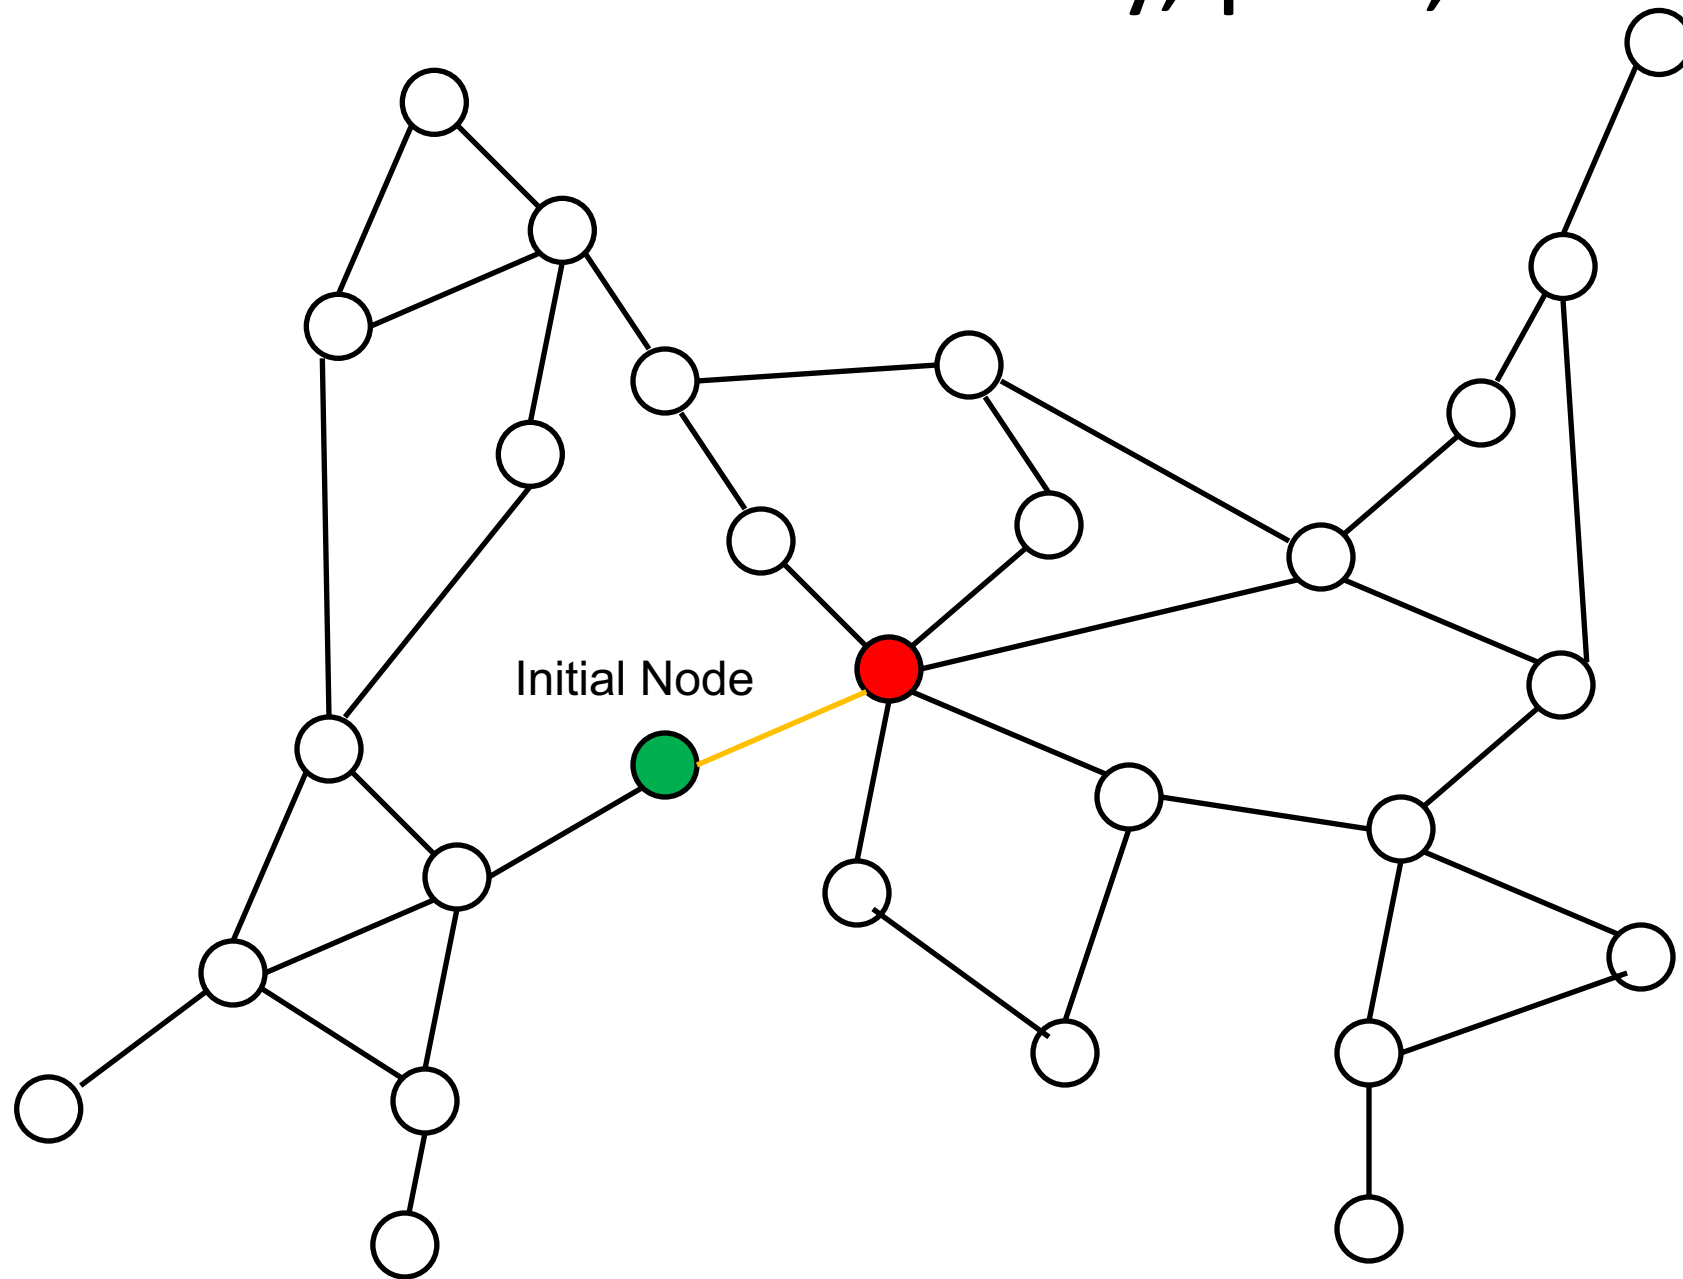

- How many people end up informed if:
  - person  $i$  is initially informed,
  - each informed person tells each of its neighbors with probability  $p$  in each period,
  - run for  $T$  periods?

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Diffusion Centrality, $p=.5$ , $T=4$

# Theorem relating diffusion centrality to others:

If communication occurs just once ( $T=1$ ) then diffusion centrality is proportional to degree centrality.

If communication occurs many times ( $T$  is large) and  $p$  is large enough then diffusion centrality converges to eigenvector centrality.

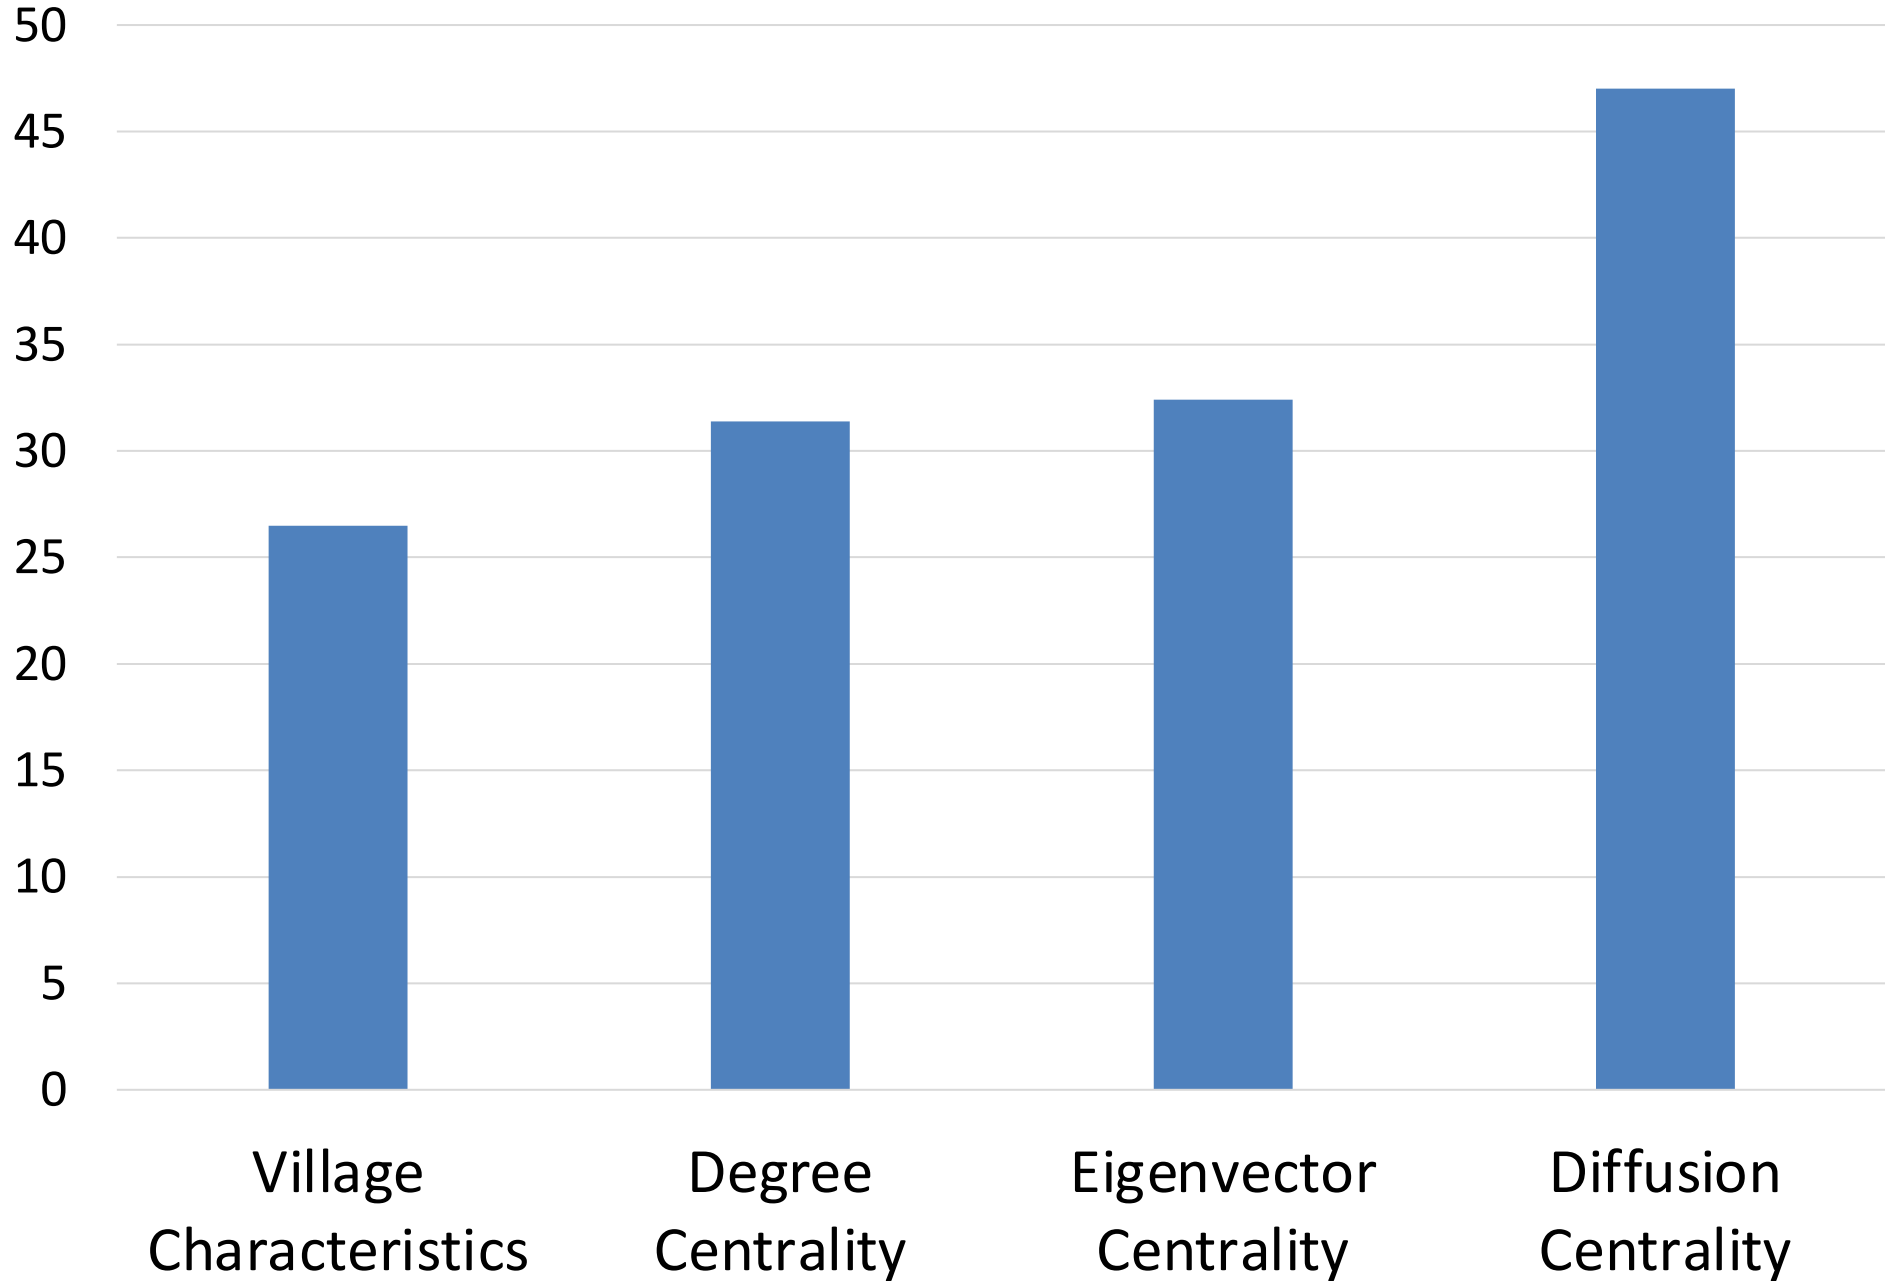

# Importance of Injection Points:

- Hypothesis 1: higher *degree* centrality of first-informed people in a village leads to higher diffusion
- Hypothesis 2: higher *eigenvector* centrality of first-informed people in a village leads to higher diffusion
- Hypothesis 3: higher *diffusion* centrality of first-informed people in a village leads to higher diffusion

# Percent of Loan Participation/Diffusion Explained

# Network Diffusion

- Networks impact market participation
- Need to measure centrality appropriately!

# Outline

- Diffusion on networks impacts market participation
- **Networks are changed by the market, multiple layers**
- Multiple layers of networks impact diffusion

# Timeline

- 2006 We surveyed 75 villages that the bank intended to enter
- 2007-2010 Bank entered 43 villages offered loans, not other 32
- 2011-2012 We resurveyed all villages

# Kenneth Arrow 1999

“This leads to an important and long-standing question: does the market (or, for that matter, the large, efficient, bureaucratic state) destroy social links that have positive implications for efficiency?”

# Kenneth Arrow 1999

“This leads to an important and long-standing question: does the market (or, for that matter, the large, efficient, bureaucratic state) destroy social links that have positive implications for efficiency?”

Here: Does availability of formal loans change informal networks?

# Do Networks Change?

- Does the introduction of formal loans change the informal networks? **Yes**

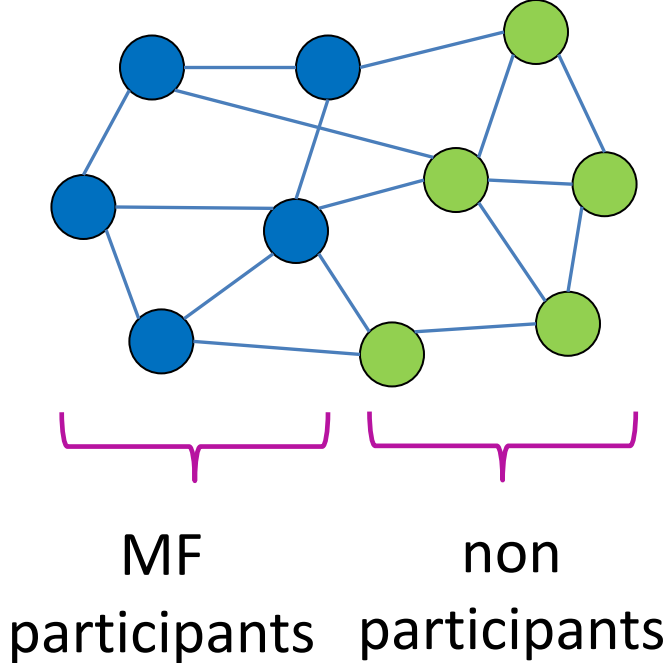

# Do Networks Change?

- Does the introduction of formal loans change the informal networks? Yes

**Whose networks change? Just loan takers?**

Villages with No Loans

Villages that Got Loans

■ Low ■ High

# Networks Change and it Matters

- Introduction of formal loans change the informal networks.
- Changes networks of those not getting loans too
- Worse risk-sharing for those not getting loans

# Network Changes

- Explanation for loss of networks by everyone even though only some people got loans:

# Network Changes

- Explanation for loss of networks by everyone even though only some people got loans:
- Externalities
  - takes effort to socialize
  - people who got loans decrease socializing
  - then so do people who did not get loans...

# Network Changes

- Explanation for loss of networks by everyone even though only some people got loans:
- Externalities
  - takes effort to socialize
  - people who got loans decrease socializing
  - then so do people who did not get loans...

Then this might impact all networks, not just borrow/lend?

# Fraction of Relationships Retained 2012-2006

# Fraction of Relationships Retained 2012-2006

## So Far:

- Networks determine diffusion of microfinance
- Market changes networks: loss of relationships by all villagers and including non-borrowing networks
- Networks are intertwined: how does that impact diffusion?
  - Let us better understand network layers and their impact...

# Outline

- **Diffusion on networks impacts market participation**
- **Networks are changed by the market, multiple layers**
- **Multiple layers of networks impact diffusion**

**Chandrasekhar, Chaudhary, Golub, Jackson (2023)**

# Experiment on Diffusion:

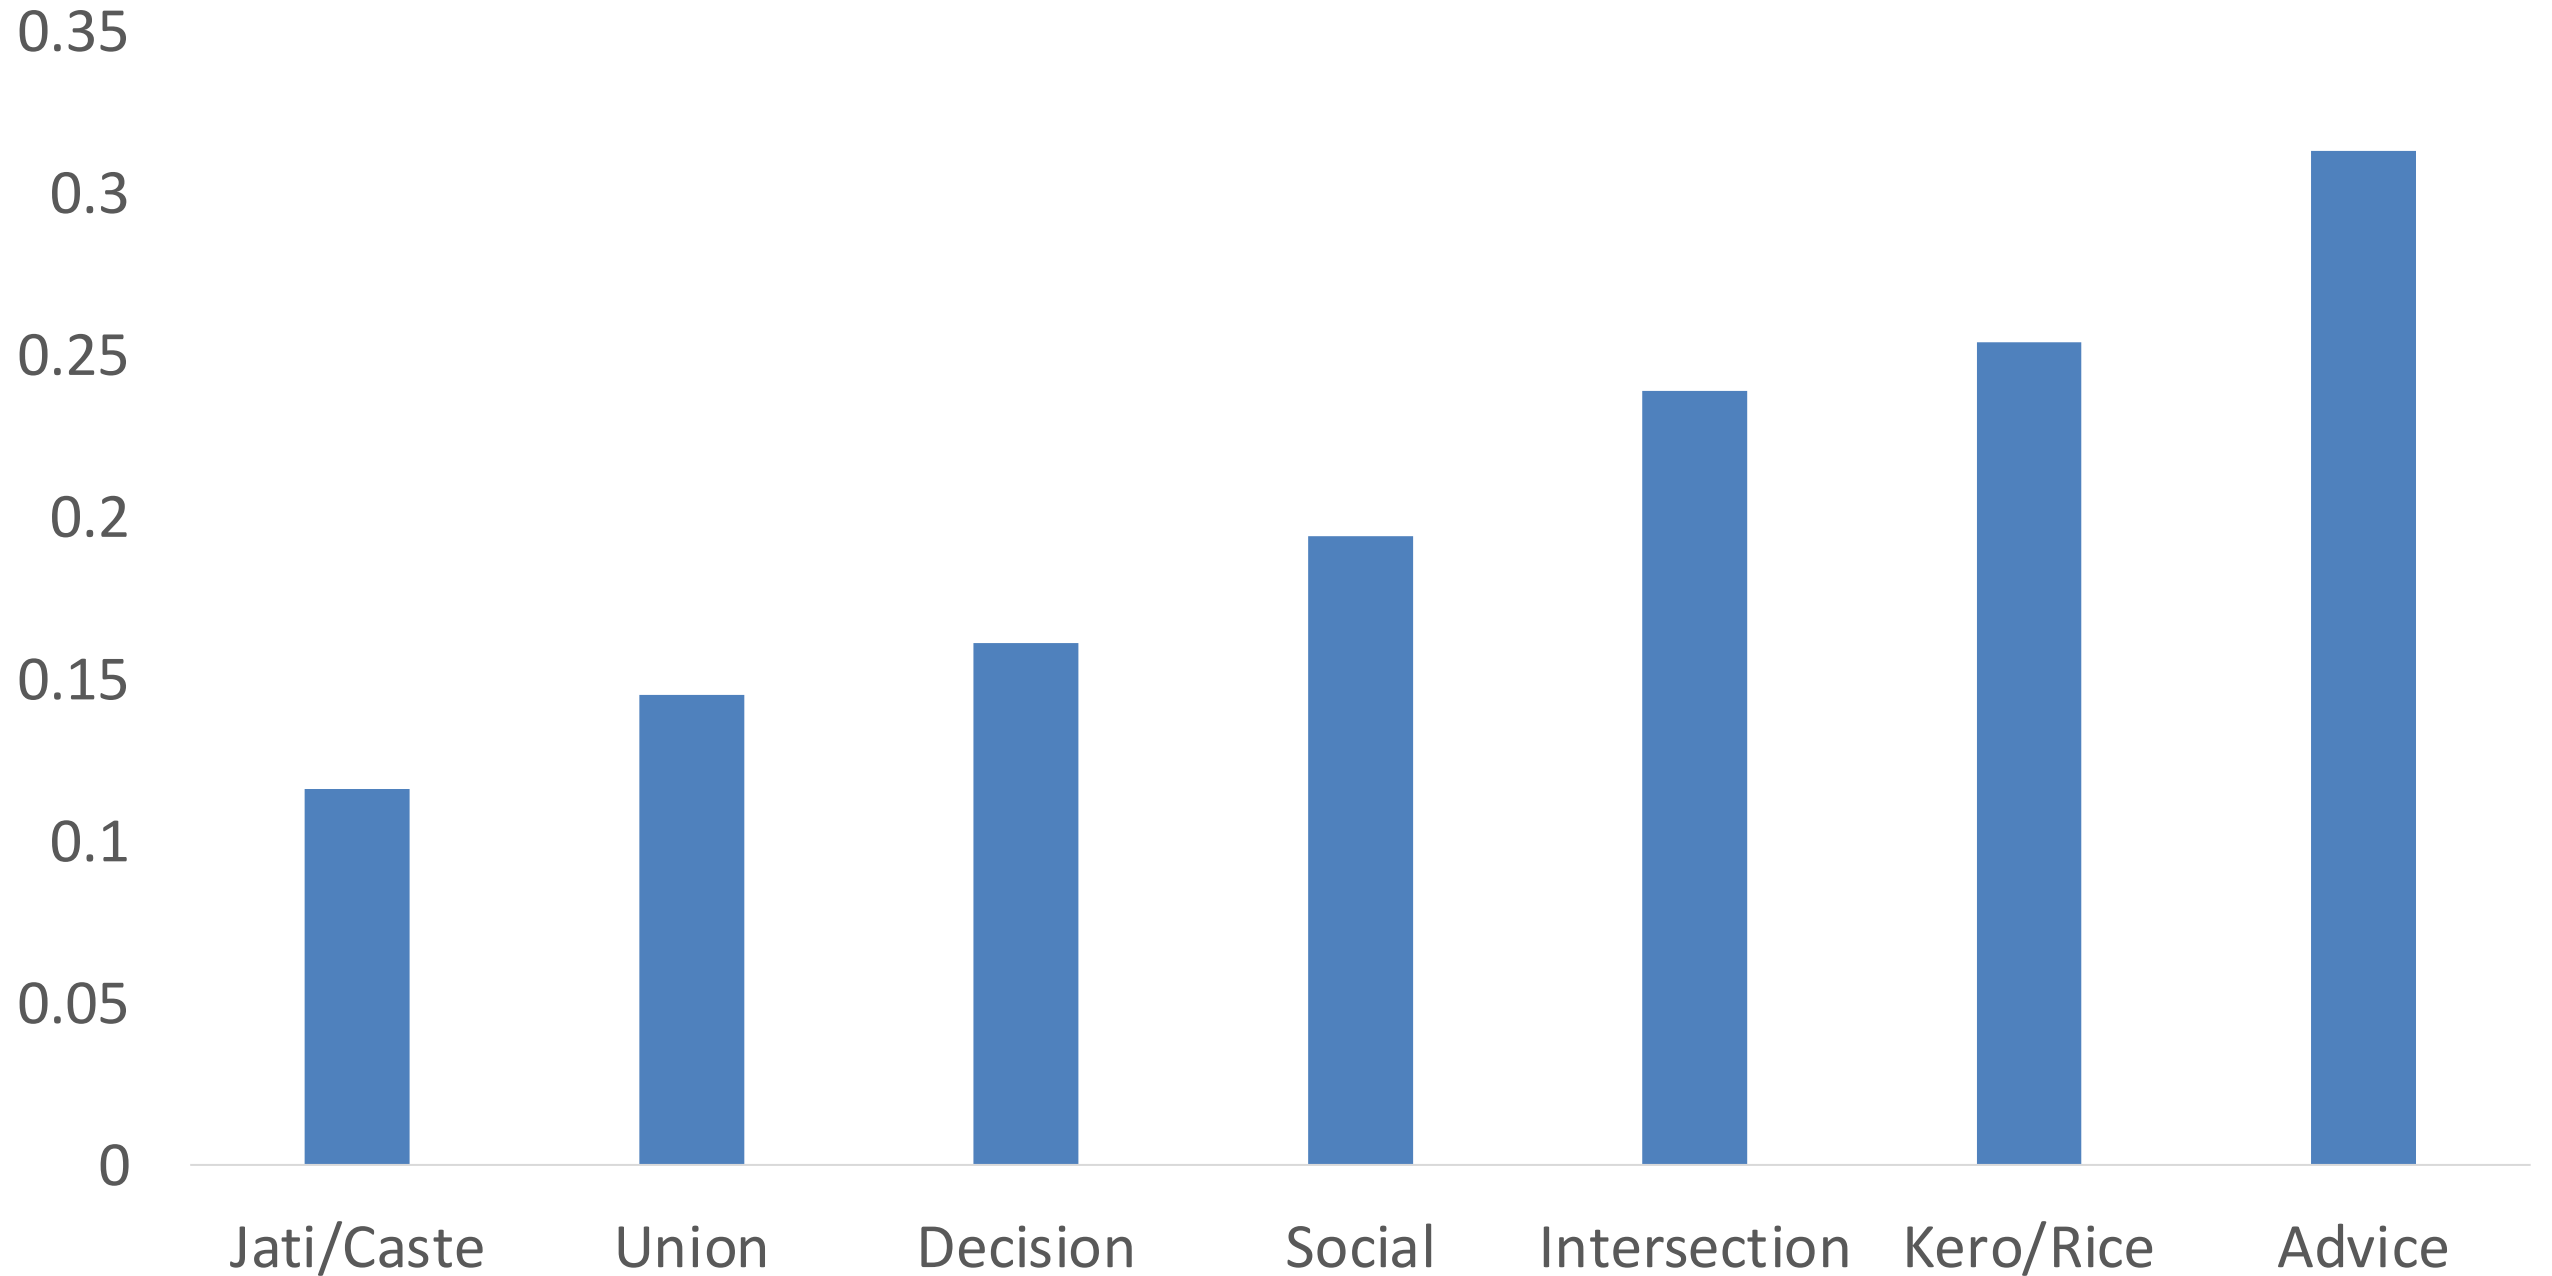

- Spread information about a chance to win a cell phone
  - Roll dice, win 50 to 275 rupees, if roll a 12 get cell phone (3000 rupees)
- Randomly choose 3 to 5 people to ask to spread information – the “seeds”
- 68 villages

# Diffusion

- Which network layers predict diffusion in the experiment?
- Look at `diffusion centrality' of seeds according to network layer
- See which network layers predict diffusion

# Percent of Diffusion Explained

# Implications for Diffusion

- Different layers are differently predictive, but multiple layers matter
- Rethink diffusion in light of multiplexing
  - How multiplexing impact diffusion?
  - Theory, field experiment, simulations

# Multiplexing and Diffusion

- Does diffusion depend on amount of multiplexing?

# Less Multiplexed

# Less Multiplexed

# Less Multiplexed

# Proposition: Multiplexing Hurts Diffusion under Simple Contagion

With simple contagion or diffusion:

people who are more multiplexed are less likely to be informed or infected

overall infection is **decreasing** in multiplexing.

	Participation
High Multiplexing x Seed Set Centrality	-.039**
	(.017)
Seed Set Centrality	.052***
	(.016)
High Multiplexing	-.023
	(.016)
Observations	68

# Impact of Multiplexing

- People who are more multiplexed are less informed
- They have less diverse information access
- Villages with more multiplexing are worse at spreading information

# Who Multiplexes?

- Does multiplexing vary across individuals?
- Does multiplexing vary across villages?
- Which ones are more multiplexed?

	High Multiplexing
Poverty Index	.017**
	(.007)
Observations	12732

# Summary

- Networks impact market participation
- Market participation changes networks, for everyone,
- Increased variance in consumption for non-loan takers,
- Changes non-borrowing networks
- Multiple layers of networks affect diffusion

# Policy Thoughts

- Substantial unintended consequences of loan introduction
  - Non-loan takers suffer increased consumption variance
- Need multi-faceted policies to address externalities between:
  - informal networks and markets
  - markets and informal networks
  - different people
  - different layers of networks...

# Thoughts for Researchers

- Cannot study `markets' without analyzing informal networks
- Form networks for one purpose, but use them in many – need to understand multiplexing...
- Reanalyzing diffusion with many network layers
  - Multiplexing hurts simple diffusion
  - Multiplexing can help in other contexts?

# Discussion
